Owens Corning is committed to safeguarding, sustaining and improving the environment for the benefit of current and future generations.

Owens Corning believes that key conclusions, regarding the impact of human activity on global climate change, have earned widespread support requiring the reduction of greenhouse gas emissions (GHG) around the world. We recognize climate change will have a significant impact on the world’s water resources.

Owens Corning is well positioned to help address this issue through the increased energy efficiency gained from the use of many of the products we produce and the reductions in GHG emissions that occur when these products are used. This is an opportunity for Owens Corning to make a measurable difference in global sustainability.

We are specifically committed to:

- Using the Product Stewardship process (including Life Cycle Management) to measure and amplify the benefits of our products and services to society.
- Working with our stakeholders globally to develop technologies and solutions to achieve energy-efficient buildings with the goal of achieving no net carbon releases.
- Improving our GHG footprint by reducing the GHG emissions intensity of our manufacturing facilities while reducing our absolute emissions.
- Being an active and constructive participant on this issue on the world stage, including the advocacy of effective pricing signals to accelerate energy efficiency improvements, renewable energy deployment and cross-economy GHG emission reductions.
- Reducing our water footprint by implementing water conservation and risk mitigation programs.
- Publishing an annual sustainability report that reflects our challenges and progress while providing transparency through an external verification process.
- Educating our suppliers and business partners to ensure they are mindful of their environmental, social and economic impacts. Through our Supplier Code of Conduct, we expect our partners to implement programs that reduce their environmental impacts and establish goals while monitoring their progress.

Our solution for this important global challenge resides in the products we offer society, our ability to innovate and develop practical and affordable sustainability solutions from our science and technology efforts, the management of our energy and environmental footprint, and actively participating in selected ongoing international and national programs for climate change policy and resolution.
